An AI operations system for a property company

From a new contractor's paperwork to a matched furniture invoice. The AI reads, checks, drafts, and builds. People approve, send, sign, and pay.

Fictional company (Palmquay Properties, Sarasota) and fake data, so it can be shown. Designed and directed by the author; the code was written by Claude Code.

AI does it · A person decides

Onboard a contractor

Is this vendor allowed to work for us?

8 vendors · 6 problems planted, 6 caught · 0 emails sent by the AI

Paperwork arrives
Tax form, insurance certificate, state license, work request

→ **`/intake`**
Reads every document and applies the written rules: dates, coverage minimums, names. Result: ready, on hold, or blocked, with the evidence.
Caught: expired insurance, low coverage, missing tax form, company not named on the insurance, name mismatch, a license about to expire

→ **`/chase`**
Blocked or on hold: drafts one polite, specific follow-up with a deadline.

`/route`
Ready: builds the approval packet, approvers in order by dollar amount.

→ **Facilities Manager**
Reviews and sends it. The AI never sends email.

→ **1 to 4 people sign**
A $120,000 job needs all 4. The AI leaves every signature blank.

→ **`/status`**
One line per vendor: stage, blocker, days waiting.

Buy what a project needs

Furnishing one apartment, approved suppliers only

7 steps · 13 problems planted, 13 caught · 0 orders or payments by the AI

`/scope`
Turns the request into a brief; asks once for what's missing.
A blank wall length; a king bed too big for the room

→ **`/source`**
Checks each item's lead time against the install date.
A sofa 27 days late

→ **`/quote`**
One comparison table and a purchase request draft.
A $185 fee in a footnote; an expired quote

→ **`/approve`**
Checks every product against the plan. Unclear goes to a person.
A rug 2 in too wide; the wrong finish

→ **`/change`**
Prices each substitution; the approved order can't change until signed.
A backorder swap $108 over budget

→ **`/deliver`**
Flags late or misaddressed deliveries and opens a task.
A bed 5 days late; a dresser sent to the wrong unit

→ **`/match`**
Invoice vs. order vs. receipt.
Billed $872 against $713

→ **People decide**
Answer the question, approve the order and the change, send the update. Finance pays.

Controls from a real procurement packet

Copied from a public agency's approval packet (structure only)

3 steps · 6 problems planted, 6 caught · 0 signatures by the AI

`/screen`
Every contractor's conflict-of-interest disclosure; every name checked against an exclusion list.
An owner related to the only approver; an excluded company on an insurance certificate

→ **Legal reviews**
The related approver is recused; the next one signs.

→ **`/request`**
The approval request: type by dollar size, purpose, funding line, quotes per line, a certification.
Two single-source lines; the lowest price not picked (27 days late)

→ **Facilities Manager**
Writes the justifications and signs the certification.

→ **`/closeout`**
Running totals and open items; a supplier's "all delivered" checked against the receipt.
A false completion claim: 2 items not received

→ **Two signatures**
The supplier certifies, the Facilities Manager verifies. The AI leaves both blank.

Written rules
One rules file and one numbers file; a check confirms the two agree.
operating policy, single source of truth

People approve
The AI never sends, signs, orders, or pays. It stops and asks.
human in the loop, segregation of duties

A second AI, the checker
Set up to only read, it reviews the work, with planted mistakes mixed in.
maker-checker review, least privilege by design

Audit log
Every action is one row. Rows are hash-chained, so an edit shows.
audit trail, tamper evidence

Tests first
Answers locked before the first run; 41 of 41 checks pass; planted breaks prove the checks catch errors.
acceptance tests, evals, mutation testing

One screen
A dashboard rebuilt from the records; a test recounts every number in its tiles and tables.
observability, reconciliation

14 skills · 4 approvers · 31 audit log rows · 20 decisions waiting on people, each with the AI's suggestion

Same structure fits any process with intake, checks, approvals, and an audit trail.
